

PERSONALIZED AUDIO REQUESTS FOR CONSCIOUS SEDATION**ABSTRACT**

A conscious sedation system comprising a controller which generates an audio request for a predetermined response from a patient, the request including a personalized message and a response testing apparatus including a request assembly and a response assembly. The request assembly communicates to the patient the request generated by the controller and the response assembly detects the response and communicates the response to the controller. The conscious sedation system can have an input to include the personalized message.
